

Statewide Redistricting Plan – 400 Representatives

Base districts and weighted floterial districts that adhere to county lines

County	Reps	Per Rep	Base Districts	Float Districts	Total districts	Town/Ward with own rep	Deviation
Belknap	18	3338.22	9	3	12	8	-2.2% to +0.05%
Carroll	15	3,187.87	7	2	9	2	.2% to + 5%
Cheshire	23	3,352.91	16	3	19	12	-3.3% to +3.3%
Coos	10	3,305.50	9	1	10	2	-3.4% to +.09%
Grafton	27	3,300.67	20	5	25	10	-.9% to + 3.7%
Hillsborough	122	3,248.60	42	10	51	37	-4.8 to +6.2%
Merrimack	45	3,254.33	26	5	31	20	+5% to -3.6%
Rockingham	90	3,280.26	35	9	43	31	+5% to -3.6%
Strafford	37	3,328.19	20	3	23	17	+2.8% to - 5.2%
Sullivan	13	3,364.77	9	2	11	6	+2.2% to - 2.7%
TOTAL	400		193	43	236	145	

The County by County detailed Charts are below. The “math” spreadsheets are available as separate documents. Please note that the districts that are not a part of a float are presented first, followed by the floterial groupings.

THE STEPS TO BUILD THE DISTRICTS

STEP 1: Create base districts by allocating the maximum number of representatives to every town or city ward that deserves its own using the COUNTY ideal.

- We use the county ideal because it is the only way to keep the small districts and keep the all the districts (including the weighted floats) with-in the state deviation. **Deviation is still calculated using the state ideal**
- This isn't always possible where deserved because of geography and deviation. Those places are addressed in step 2

STEP 2: Create multi-town/ward districts from the towns and wards left over, keeping them as small as possible and accounting for geography and deviation.

STEP 3: Adjust towns and wards from step 1 & 2 to include any orphan towns in multi-town base districts. **BASE DISTRICTS COMPLETE**

STEP 4: Create floterials using the overage contribution off of the county ideal from each base district with a goal of creating small, single member floterials where possible. Create multi-member floats where single members are not possible.

- Adjust districts to account for geography and communities of interest.

STEP 5: Calculate weights for floats

Town's % of the Base District X the % of the floterial x the # of members in the floterial= the towns representation in the floterial

STEP 6: Reconfirm deviation of the towns and wards using the state deviation.

DEVIATION CALCULATION

- 1) Take the number of reps a town/ward deserves divided by 3291
- 2) Subtract the # of members allocated as a proportion of their contribution to the base district + floterial

So deviation is a raw number (the difference between a district's allocated size and the statewide ideal), but it's expressed as a percentage of that raw number divided by the statewide).

EXPANDED DEVIATION CALCULATION

- 1) Traditional x-member districts not in floterials, which could be made up of a single town, city, or ward, or multiple towns, cities, or wards:
 - a. Pd = Population of District
 - b. N = number of members
 - c. Deviation = $((Pd - (N * 3291)) / 3291) * 100$
 - 2) Floterial + x-member districts, treated as a conglomerate:
 - a. Pd = Population of total collection of districts
 - b. N = number of members
 - c. Average Deviation = $((Pd - (N * 3291)) / 3291) * 100$
- (these are the same formulae, applied to two different scenarios)

And then there's the formula for floterial electoral contribution:

Pa = Population of district A

Na = Number of members for district A

Nx = Number of members allocated to the x-member districts also contributing to district A's floterial (including Na)

Pt = Population of the total floterial+x-member conglomerate

Pi = Pt / Nt = Ideal district population

Ra = Pa - (Pi * Na) = District A's floterial vote contribution

Rt = Pt - (Pi * Nx) = Total floterial remainder

District A's vote contribution coefficient = Ra / Rt
